# PROTECT YOUR DOG FROM A SERIOUS THREAT.1

Your dog may be exposed to Leptospira bacteria by drinking, swimming or walking through contaminated water.

# WHAT CAN YOU DO?

Vaccinate your dog to help prevent leptospirosis.

Keep your dog from drinking, swimming or wading in water that might be contaminated with animal urine.

Contact your veterinarian for information on leptospirosis risks in your area.

#### TRUSTED. PROVEN.

Your veterinarian chooses RECOMBITEK vaccines for many important reasons.

Through advanced technology,
RECOMBITEK canine vaccines
deliver proven protection
against disease
for puppies and dogs.

If you have any questions about vaccination against leptospirosis or other diseases, please talk to your veterinarian.

# **VACCINATE YOUR DOG.**

Leptospirosis is a serious bacterial disease that infects domestic animals, wildlife and humans. It is a serious worldwide zoonotic disease, meaning it's a disease that can infect both animals and humans.<sup>2</sup>

The disease-causing bacteria are spread through the urine of infected animals and can survive from weeks to months in soil and surface waters such as lakes, streams, rivers and stagnant water like puddles.<sup>2</sup> Leptospirosis can cause fever, jaundice, kidney failure, abortion and even death.2

Leptospirosis is typically spread when an opening in the skin or mucous membrane (eyes, nose infected urine. Your dog may be exposed to Leptospira bacteria by drinking, swimming or walking through contaminated water. The curious nature of your dog, following their nose, may also bring them into contact with

#### The threat to humans.

opossums, cattle and swine According to the can all carry and spread leptospirosis. Centers for Disease Control and Prevention (CDC), 100-200 human cases of leptospirosis are reported in the United States annually.3 In people, the symptoms of leptospirosis are often flu-like and in rare cases the disease can develop into a life-threatening illness. Most human cases of leptospirosis are treated with antibiotics.4

## Clinical signs, diagnosis and treatment.

Signs of a leptospirosis infection in dogs may include fever, weight loss, vomiting, diarrhea, dehydration and abdominal pain.<sup>2</sup> If you suspect your dog has been infected, contact your veterinarian who may perform urine and blood tests to determine if your dog has leptospirosis. Antibiotics and fluid therapy may be necessary to treat the disease. If left untreated, your dog could develop kidney or liver failure and the disease may even be fatal.

## Vaccinate to help protect your dog.

Your veterinarian is committed to helping you make the informed choices for your dog's health. To help give your dog the leptospirosis protection they need, this clinic recommends vaccination with RECOMBITEK® 4 Lepto.

This vaccine provides safe, effective protection against disease and shedding for the 4 most common strains of Leptospira bacteria.5†
